

Introduction to GIS in R

Wildlife Tourism College
Pardamat Conservation Area
17 September 2024

**EARTH SCIENCE
APPLIED SCIENCES**

Award: 80NSSC23K1537

Learning Objectives

- Create and import spatial data into R
- Basic vector and raster analysis
- Introduction to remote sensing
- Raster data extraction
- Simple spatial analysis
- Making maps in R

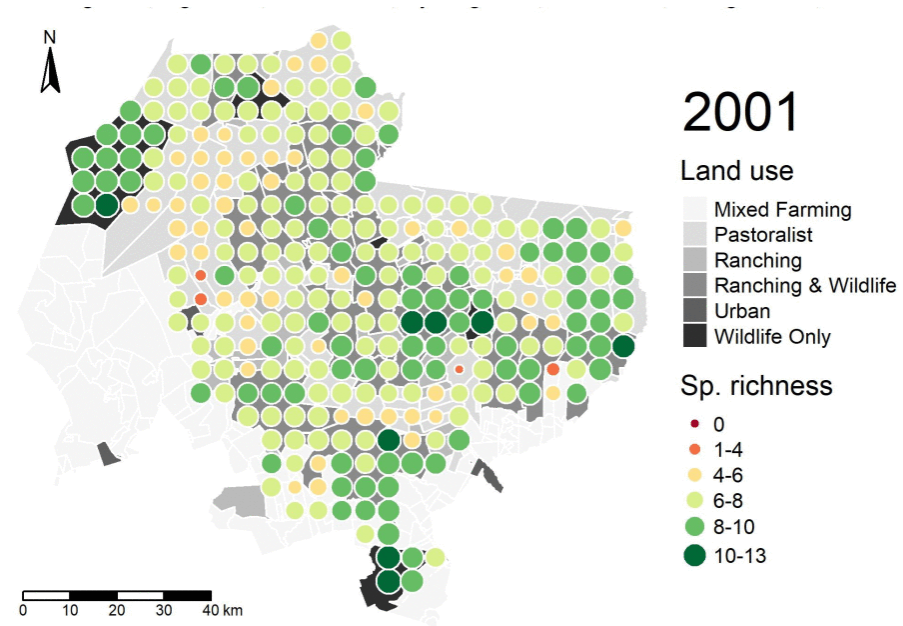

Geographic Information Systems

A computer-based system to create, manage, analyze, and display geographical data

GIS DATABASE

TYPES of SPATIAL DATA:

VECTOR

VS

RASTER

RASTER

VECTOR

graphic made of pixels

graphic made of vector objects

© vector-conversions.com

Vector Data

Points (Vector)

Single point (no area)

- Examples: GPS points, animal locations

Lines (Vector)

- Series of points connected together in order
- Has **length**, but not area
 - Examples: roads, boundaries, streams, route traveled

Polygons (Vector)

Series of points connected

- Has length, width, and area
 - Examples: buildings, administrative boundaries, protected areas

Vector data

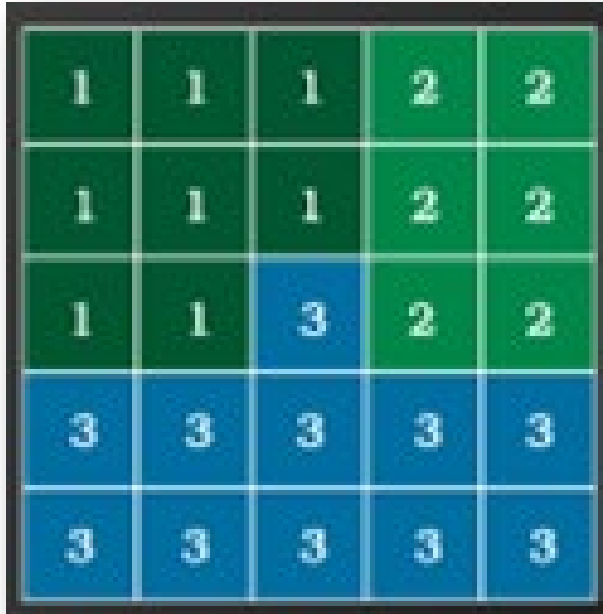

Attributes are attached to each object:

- Examples: species, date, depth, age, habitat

	OBJECTID	AREA	PERIMETER	COUNTY3_	COUNTY3_ID	COUNTY
1	36	0.206000000000	2.537000000000	37.000000000000	36.000000000000	Murang'a
2	35	0.106000000000	1.677000000000	36.000000000000	35.000000000000	Kisii
3	34	1.454000000000	6.862000000000	35.000000000000	34.000000000000	Narok
4	33	0.072000000000	1.505000000000	34.000000000000	33.000000000000	Nyamira
5	40	1.774000000000	7.280000000000	41.000000000000	40.000000000000	Kajiado

Raster data

RASTER

1	1	1	2	2
1	1	1	2	2
1	1	3	2	2
3	3	3	3	3
3	3	3	3	3

- Numbers or values in each pixel (cell)
- Good for mapping things that change continuously (like elevation)

RASTER

*Digital Elevation Model
(DEM)*

Spatial Resolution: the level of detail of your data (e.g., pixel size)

Decrease Pixel Size

Increase Resolution

Summary
